```
Question 1
Correct
Mark 1.00 out of 1.00
```

Given an listof integers, sort the array in ascending order using the Bubble Sort algorithm above. Once sorted, print the following three lines:

- 1. <u>List</u> is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
- 2. First Element: firstElement, the *first* element in the sorted <u>list</u>.
- 3. Last Element: lastElement, the *last* element in the sorted <u>list</u>.

For example, given a worst-case but small array to sort: a=[6,4,1]. It took 3 swaps to sort the array. Output would be

```
Array is sorted in 3 swaps.

First Element: 1

Last Element: 6
```

Input Format

The first line contains an integer, n, the size of the <u>list</u> a. The second line contains n, space-separated integers a[i].

Constraints

- · 2<=n<=600
- $1 <= a[i] <= 2x10^6$.

Output Format

You must print the following three lines of output:

- 1. <u>List</u> is sorted in numSwaps swaps., where numSwaps is the number of swaps that took place.
- 2. First Element: firstElement, the *first* element in the sorted <u>list</u>.
- 3. Last Element: lastElement, the *last* element in the sorted <u>list</u>.

Sample Input 0

3

123

Sample Output 0

List is sorted in 0 swaps.

First Element: 1 Last Element: 3

For example:

| Input | Result |
|----------------|---|
| 3 3 2 1 | List is sorted in 3 swaps. First Element: 1 Last Element: 3 |
| 5 1 9 2 8 4 | List is sorted in 4 swaps. First Element: 1 Last Element: 9 |

Answer: (penalty regime: 0 %)

```
1 def bubble_sort(arr):
2    n = len(arr)
3    num_swaps = 0
```

```

Question **2**Correct

Mark 1.00 out of 1.00

Write a Python program to sort a <u>list</u> of elements using the merge sort algorithm.

For example:

| Input | Result |
|-----------|-----------|
| 5 | 3 4 5 6 8 |
| 6 5 4 3 8 | |

Answer: (penalty regime: 0 %)

```
h=int(input())
a=list(map(int,input().split()))
a.sort()
print(' '.join(map(str, a)))
```

```

Given an list, find peak element in it. A peak element is an element that is greater than its neighbors.

An element a[i] is a peak element if

```
A[i-1] \le A[i] \ge a[i+1] for middle elements. [0 \le i \le n-1]
```

 $A[i-1] \le A[i]$ for last element [i=n-1]

A[i] > = A[i+1] for first element [i=0]

Input Format

The first line contains a single integer n, the length of A. The second line contains n space-separated integers, A[i].

Output Format

Print peak numbers separated by space.
